## Physics with Synno - Motion-2 - Lesson 2

## M.1.2.1 Addition of Vectors

If we have two vectors $a$ and $b$, to add them we put the vectors head to tail and the result of the addition is the vector drawn from the starting point to the finishing point.

## One-Dimension

$$
s_{1}=15 \mathrm{~m} \text { east }+\xrightarrow{s_{2}=5 \mathrm{~m} \text { east }}=\xrightarrow[s_{\mathrm{R}}=20 \mathrm{~m} \text { east }]{\substack{s_{1}=15 \mathrm{~m} \text { east } \quad s_{2}=5 \mathrm{~m} \text { east }}}
$$

Eg. Determine the resultant force on a box that is acted upon by the following forces:
16N Up, 22 N Down, 4 N Up, 17 N Down
Take Up as +ve
$16-22+4-17=-19$
Resultant force is 19 N Down

## Two-Dimensions

We will use Pythagoras and Trigonometry (SOH CAH TOA) to help with the calculation.

Example Add the vectors 5 m North and 8 m West

$$
\begin{aligned}
& y^{2}=8^{2}+5^{2} \\
& y^{2}=64+25 \\
& y=\sqrt{89} \\
& y=9.43 m \\
& x=\tan ^{-1}\left(\frac{8}{5}\right) \\
& x=58^{\circ}
\end{aligned}
$$

Vector sum is $9.43 \mathrm{~m} \mathrm{~N} 58^{\circ} \mathrm{W}$

Example A skater is pushed by two others. As shown in the diagram below.
If $\mathbf{F}_{1}$ is 5 N East and $\mathbf{F}_{2}$ ia 4 N North, what is the resultant force on the skater.

(a)

$$
\begin{aligned}
& y^{2}=4^{2}+5^{2} \\
& y^{2}=16+25 \\
& y=\sqrt{41} \\
& y=6.4 N \\
& x=\tan ^{-1}\left(\frac{4}{5}\right) \\
& \quad x=38.7^{\circ}
\end{aligned}
$$

$$
z=90-38.7=51.3
$$

Vector sum is $6.4 \mathrm{~N}, \mathrm{~N} 51.3^{\circ} \mathrm{E}$
